

DESCRIPTION

The PT2257 is an electronic volume controller IC utilizing CMOS technology specially designed for the new generation of AV entertainment products. It has two (2) built-in channels making it ideally suitable for mono and stereo sound applications. The PT2257 provides an I²C control interface, an attenuation range of 0 to -79dB, low noise, and high channel separation. It is housed in an 8-pin, DIP or SOP package. The PT2257's pin assignments and application circuit are optimized for easy PCB layout and cost saving advantages.

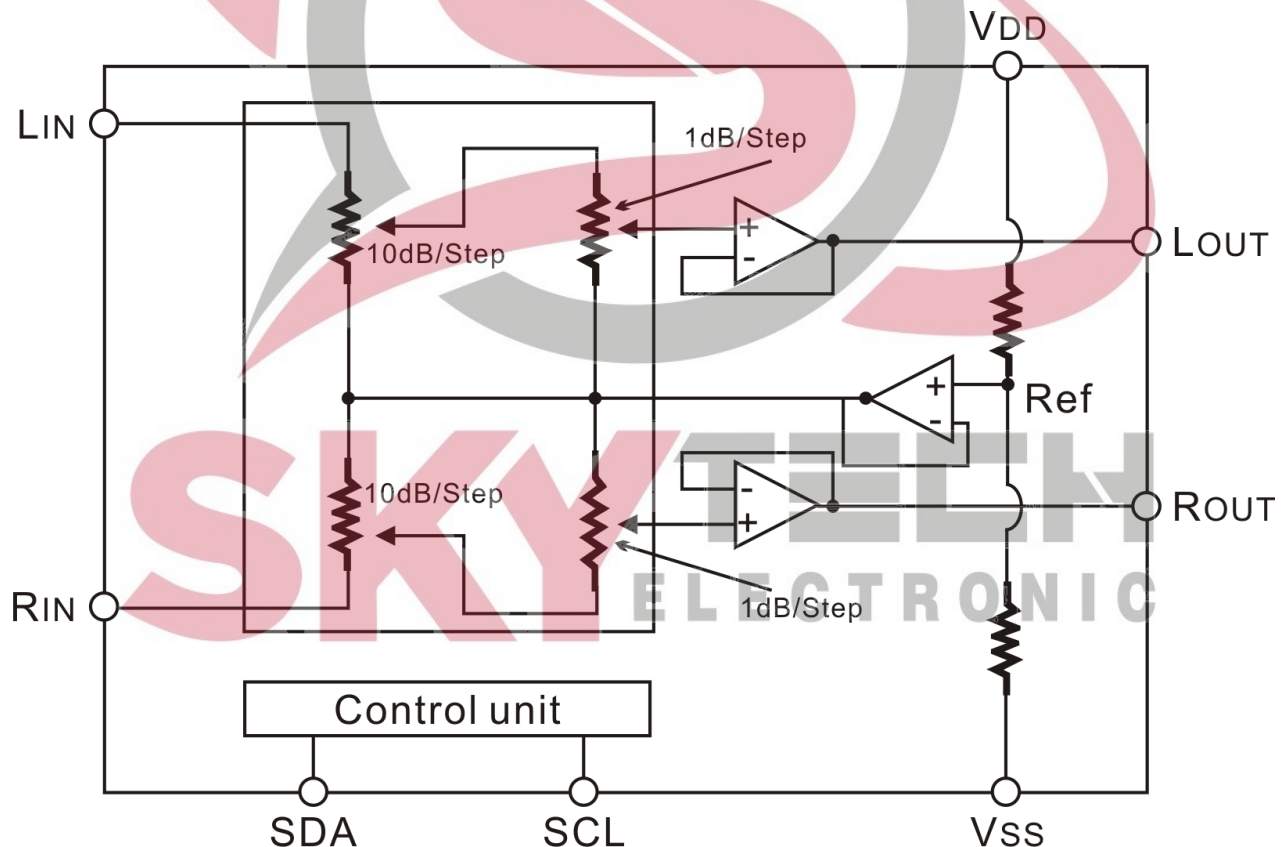

FEATURES

- CMOS technology
- Low power consumption
- Least external components
- Attenuation range: 0 to -79dB at 1dB/step
- Operating voltage: 3 to 9V
- Low Noise, S/N Ratio>100dB (A-weighting)
- Two channel output
- Available in 8-pin, DIP or SOP

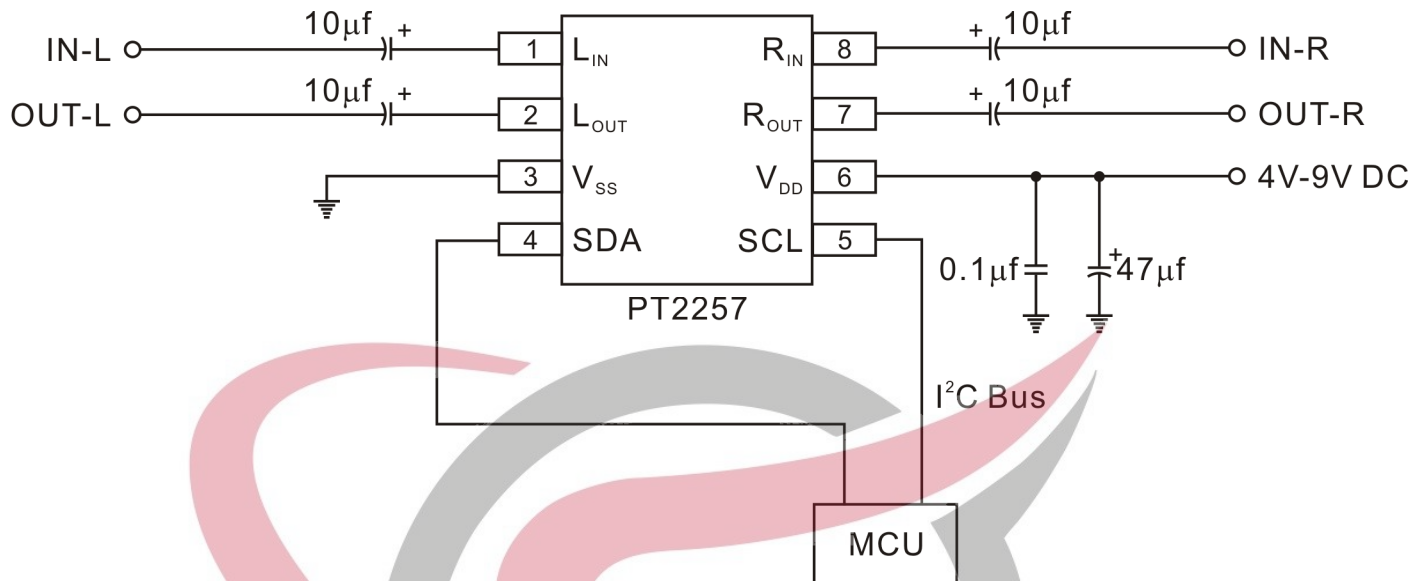

APPLICATIONS

- AV surround audio equipment
- Car audio
- Mini compo
- Computer multi-media speaker
- Other audio equipment

PIN DESCRIPTION

Pin Name	I/O	Description	Pin No.
L _{IN}	I	Left input channel Connect a capacitor to audio source	1
L _{OUT}	O	Left output channel Connect a capacitor to audio output	2
V _{SS}	-	Ground	3
SDA	I	I ² C data input	4
SCL	I	I ² C clock input	5
V _{DD}	-	Power supply	6
R _{OUT}	O	Right output channel Connect a capacitor to audio output	7
R _{IN}	I	Right input channel Connect a capacitor to audio source	8

FUNCTION DESCRIPTION

BUS INTERFACE

Data are transmitted to and from the microprocessor to the PT2257 via the SDA and SCL. The SDA and SCL make up the BUS Interface. It should be noted that the pull-up resistors must be connected to the positive supply voltage.

DATA VALIDITY

A data on the SDA Line is considered valid and stable only when the SCL Signal is in HIGH State. The HIGH and LOW States of the SDA Line can only change when the SCL signal is LOW. Please refer to the figure below.

START AND STOP CONDITIONS

A Start Condition is activated when

1. The SCL is set to HIGH and
2. SDA shifts from HIGH to LOW state.

The Stop Condition is activated when

1. SCL is set to HIGH and
2. SDA shifts from LOW to HIGH state.

Please refer to the timing diagram below.

BYTE FORMAT

Every byte transmitted to the SDA Line consists of 8-bit. Each byte must be followed by an Acknowledge Bit. The MSB is transmitted first.

ACKNOWLEDGE

During the Acknowledge Clock Pulse, the master (μP) puts a resistive HIGH level on the SDA Line. The peripheral (audio processor) that acknowledges has to pull-down (LOW) the SDA line during the Acknowledge Clock Pulse so that the SDA Line is in a Stable Low State during this Clock Pulse. Please refer to the diagram below.

The audio processor that has been addressed has to generate an Acknowledge after receiving each byte; otherwise, the SDA Line will remain at the High Level during the ninth (9th) Clock Pulse. In this case, the master transmitter can generate the STOP Information in order to abort the transfer.

TRANSMISSION WITHOUT ACKNOWLEDGE

If you want to avoid the acknowledge detection of the audio processor, a simpler μP transmission may be used. Wait one clock and does not check the slave acknowledge of this same clock then send the new data. If you use this approach, there are greater chances of faulty operation as well as decrease in noise immunity.

INTERFACE PROTOCOL

The interface protocol consists of the following:

- A Start bit
- A Chip Address byte=88H
- ACK=Acknowledge bit
- A Data byte
- A Stop bit

Please refer to the diagram below:

Notes:

1. ACK=Acknowledge
2. Max. clock speed=100K bits/s

SOFTWARE SPECIFICATION

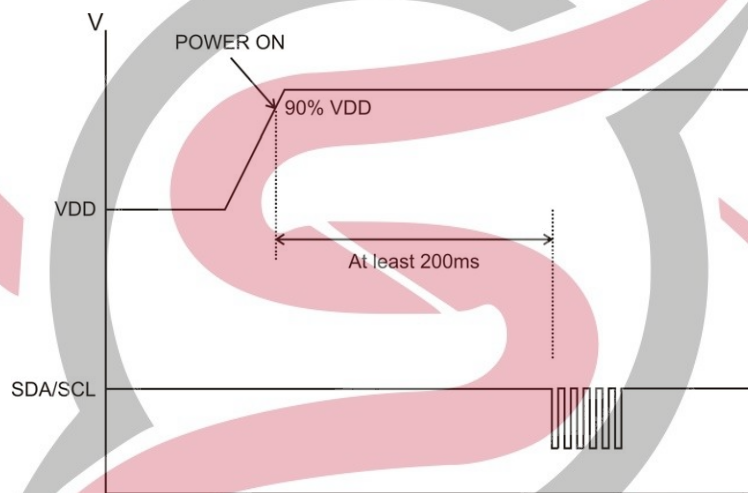

PT2257 ADDRESS

PT2257 Address is shown below:

1 MSB	0	0	0	1	0	0	0 LSB
----------	---	---	---	---	---	---	----------

I²C BUS INTERFACE START TIME

After Power is turned ON, PT2257 needs to wait for a short time in order to insure stability. The waiting time period for PT2257 to send I²C Bus Signal is at least 200ms. If the waiting time period is less than 200ms, I²C Control may fail. Please refer to the diagram below.
