LINEAR INTEGRATED CIRCUIT

CURRENT MODE PWM CONTROL CIRCUITS

DESCRIPTION

The UTC3843D/E provides the necessary features to implement off-line or DC to DC fixed frequency current mode control schemes with a minimal external parts count. Internally implemented circuits include under-voltage lockout featuring start up current less than 1mA,a precision reference trimmed for accuracy at the error amp input, logic to insure latched operation, a PWM comparator which also provides current limit control, and a totem pole output stage designed to source or sink high peak current.The output stage, suitable for driving N channel MOSFETs, is low in the off state.

FEATURES

- *Optimized for off-line and DC to DC converts
- *Low start up current(<1mA)
- *Automatic feed forward compensation
- *Pulse-by-Pulse current limiting
- *Enhanced load response characteristics
- *Under-voltage lockout with hysteresis
- *Double pulse Suppression
- *High current totem pole output
- *Internally trimmed bandgap reference
- *500kHz operation
- *Low Ro error amp

$$A = \frac{\Delta V_{pin\ 1}}{\Delta V_{pin\ 3}} ; 0 \leq V_{pin\ 3} \leq 0.8V$$

note 5:Adjust V_{cc} above the start threshold before setting at 15V.**OPEN-LOOP LABORATORY TEST CIRCUIT**

High peak current associated with capacitive loads necessitate careful grounding techniques.Timing and bypass capacitors should be connected close to pin 5 in

single point GND.The transistor and 5kΩ potentiometer are used to sample the oscillator waveform and apply an adjustable Ramp to Pin 3.

UNDER-VOLTAGE LOCKOUT

During Under-Voltage Lockout, the output driver is biased to a high impedance state. Pin 6 should be shunt

to GND with a bleeder resistor to prevent activating the power switch with output leakage currents.

ERROR AMPLIFIER CONFIGURATION

Error amplifier can source or sink up to 0.5mA

CURRENT SENSE CIRCUIT

Peak current (I_s) determined by the formula:
 $I_{smax}=10V/R_s$.

A small RC filter be required to suppress switch transients.

SLOPE COMPENSATION

A fraction of the oscillator ramp can be resistively summed with the current sense signal to provide slope compensation for converters requiring duty cycles over 50%. Note that capacitor C, forms a filter with R2 to suppress the leading edge switch spikes.

SHUTDOWN TECHNIQUES

Shutdown UTC3843D/E can be accomplished by two methods; either raise pin 3 above 1V or pull Pin 1 below a voltage two diode drops above ground. Either method caused the output of PWM comparator to be high(refer to block diagram).The PWM latch is reset dominant so that the output will remain low until the next clock cycle after the shutdown condition at pins a and/or 3 is removed .In one example, an externally latched shutdown may be accomplished by adding an SCR which be reset by cycling Vcc below the lower UVLO threshold. At this point tyhe reference turns off allowing the SCR to reset.
