

## 50 A VRPower® Integrated Power Stage

### DESCRIPTION

The SiC632 and SiC632A are integrated power stage solutions optimized for synchronous buck applications to offer high current, high efficiency, and high power density performance. Packaged in Vishay’s proprietary 5 mm x 5 mm MLP package, SiC632 and SiC632A enables voltage regulator designs to deliver up to 50 A continuous current per phase.

The internal power MOSFETs utilizes Vishay’s state-of-the-art Gen IV TrenchFET® technology that delivers industry benchmark performance to significantly reduce switching and conduction losses.

The SiC632 and SiC632A incorporate an advanced MOSFET gate driver IC that features high current driving capability, adaptive dead-time control, an integrated bootstrap Schottky diode, a thermal warning (THWn) that alerts the system of excessive junction temperature, and zero current detection to improve light load efficiency. The drivers are also compatible with a wide range of PWM controllers and supports tri-state PWM, 3.3 V (SiC632A), 5 V (SiC632) PWM logic.

### FEATURES

- Thermally enhanced PowerPAK® MLP55-31L package
- Vishay’s Gen IV MOSFET technology and a low side MOSFET with integrated Schottky diode
- Delivers up to 50 A continuous current
- High efficiency performance
- High frequency operation up to 1.5 MHz
- Power MOSFETs optimized for 19 V input stage
- 3.3 V (SiC632A), 5 V (SiC632) PWM logic with tri-state and hold-off
- Zero current detect control for light load efficiency improvement
- Low PWM propagation delay (< 20 ns)
- Faster disable
- Thermal monitor flag
- Under voltage lockout for  $V_{CIN}$
- Material categorization: for definitions of compliance please see [www.vishay.com/doc?99912](http://www.vishay.com/doc?99912)

**RoHS**  
COMPLIANT  
HALOGEN  
FREE

### APPLICATIONS

- Multi-phase VRDs for computing, graphics card and memory
- Intel IMVP-8 VRPower delivery
  - $V_{CORE}$ ,  $V_{GRAPHICS}$ ,  $V_{SYSTEM\ AGENT}$  Skylake, KabyLake platforms
  - $V_{CCGI}$  for Apollo Lake platforms
- Up to 24 V rail input DC/DC VR modules

### TYPICAL APPLICATION DIAGRAM

**PINOUT CONFIGURATION**

**Fig. 2 - SiC632 and SiC632A Pin Configuration**

PIN CONFIGURATION		
PIN NUMBER	NAME	FUNCTION
1	PWM	PWM input logic
2	ZCD_EN#	ZCD control. Active low
3	V <sub>CIN</sub>	Supply voltage for internal logic circuitry
4, 32	C <sub>GND</sub>	Signal ground
5	BOOT	High side driver bootstrap voltage
6	N.C.	Not connected internally, can be left floating or connected to ground
7	PHASE	Return path of high side gate driver
8 to 11, 34	V <sub>IN</sub>	Power stage input voltage. Drain of high side MOSFET
12 to 15, 28, 35	P <sub>GND</sub>	Power ground
16 to 26	V <sub>SWH</sub>	Phase node of the power stage
27, 33	GL	Low side MOSFET gate signal
29	V <sub>DRV</sub>	Supply voltage for internal gate driver
30	THWn	Thermal warning open drain output
31	DSBL#	Disable pin. Active low

**Notes**

- Stresses beyond those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability
- <sup>(1)</sup> The specification values indicated “AC” is  $V_{SWH}$  to  $P_{GND}$  -8 V (< 20 ns, 10  $\mu$ J), min. and 33 V (< 50 ns), max.
- <sup>(2)</sup> The specification value indicates “AC voltage” is  $V_{BOOT}$  to  $P_{GND}$ , 40 V (< 50 ns) max.
- <sup>(3)</sup> The specification value indicates “AC voltage” is  $V_{BOOT}$  to  $V_{PHASE}$ , 8 V (< 20 ns) max.

RECOMMENDED OPERATING RANGE

**Notes**

- (1) Typical limits are established by characterization and are not production tested  
(2) Guaranteed by design

**DETAILED OPERATIONAL DESCRIPTION****PWM Input with Tri-State Function**

The PWM input receives the PWM control signal from the VR controller IC. The PWM input is designed to be compatible with standard controllers using two state logic (H and L) and advanced controllers that incorporate tri-state logic (H, L and tri-state) on the PWM output. For two state logic, the PWM input operates as follows. When PWM is driven above  $V_{PWM\_TH\_R}$  the low side is turned off and the high side is turned on. When PWM input is driven below  $V_{PWM\_TH\_F}$  the high side is turned off and the low side is turned on. For tri-state logic, the PWM input operates as previously stated for driving the MOSFETs when PWM is logic high and logic low. However, there is a third state that is entered as the PWM output of tri-state compatible controller enters its high impedance state during shutdown. The high impedance state of the controller's PWM output allows the SiC632 and SiC632A to pull the PWM input into the tri-state region (see definition of PWM logic and tri-state, Fig. 4). If the PWM input stays in this region for the tri-state hold-off period,  $t_{TSHO}$ , both high side and low side MOSFETs are turned off. The function allows the VR phase to be disabled without negative output voltage swing caused by inductor ringing and saves a Schottky diode clamp. The PWM and tri-state regions are separated by hysteresis to prevent false triggering. The SiC632A incorporates PWM voltage thresholds that are compatible with 3.3 V logic and the SiC632 thresholds are compatible with 5 V logic.

**Disable (DSBL#)**

In the low state, the DSBL# pin shuts down the driver IC and disables both high side and low side MOSFETs. In this state, standby current is minimized. If DSBL# is left unconnected, an internal pull-down resistor will pull the pin to  $C_{GND}$  and shut down the IC.

**Diode Emulation Mode (ZCD\_EN#)**

When ZCD\_EN# pin is driven below  $V_{IL\_ZCD\_EN\#}$ , diode emulation mode is enabled. If the PWM signal switches below  $V_{TH\_PWM\_F}$  then the LS MOSFET is under control of the ZCD (zero crossing detect) comparator. If, after the internal blanking delay, the inductor current becomes less than or = 0 the low side is turned off. Light load efficiency is improved by avoiding discharge of output capacitors. If both high side and low side MOSFETs are required to be turned off, regardless of inductor current, the PWM input should be tri-stated.

**Thermal Shutdown Warning (THWn)**

The THWn pin is an open drain signal that flags the presence of excessive junction temperature. Connect with a maximum of 20 k $\Omega$ , to  $V_{CIN}$ . An internal temperature sensor detects the junction temperature. The temperature threshold is 160 °C. When this junction temperature is exceeded the THWn flag is set. When the junction temperature drops below 135 °C the device will clear the THWn signal. The SiC632 and SiC632A do not stop operation when the flag is set. The decision to shutdown must be made by an external thermal control function.

**Voltage Input ( $V_{IN}$ )**

This is the power input to the drain of the high side power MOSFET. This pin is connected to the high power intermediate BUS rail.

### Switch Node ( $V_{SWH}$ and PHASE)

The switch node,  $V_{SWH}$ , is the circuit power stage output. This is the output applied to the power inductor and output filter to deliver the output for the buck converter. The PHASE pin is internally connected to the switch node  $V_{SWH}$ . This pin is to be used exclusively as the return pin for the BOOT capacitor. A 20 k $\Omega$  resistor is connected between GH (the high side gate) and PHASE to provide a discharge path for the HS MOSFET in the event that  $V_{CIN}$  goes to zero while  $V_{IN}$  is still applied.

### Ground Connections ( $C_{GND}$ and $P_{GND}$ )

$P_{GND}$  (power ground) should be externally connected to  $C_{GND}$  (signal ground). The layout of the printed circuit board should be such that the inductance separating  $C_{GND}$  and  $P_{GND}$  is minimized. Transient differences due to inductance effects between these two pins should not exceed 0.5 V

### Control and Drive Supply Voltage Input ( $V_{DRV}$ , $V_{CIN}$ )

$V_{CIN}$  is the bias supply for the gate drive control IC.  $V_{DRV}$  is the bias supply for the gate drivers. It is recommended to separate these pins through a resistor. This creates a low pass filtering effect to avoid coupling of high frequency gate drive noise into the IC.

### Bootstrap Circuit (BOOT)

The internal bootstrap diode and an external bootstrap capacitor form a charge pump that supplies voltage to the BOOT pin. An integrated bootstrap diode is incorporated so that only an external capacitor is necessary to complete the bootstrap circuit. Connect a boot strap capacitor with one leg tied to BOOT pin and the other tied to PHASE pin.

### Shoot-Through Protection and Adaptive Dead Time

The SiC632 and SiC632A have an internal adaptive logic to avoid shoot through and optimize dead time. The shoot through protection ensures that both high side and low side MOSFETs are not turned on at the same time. The adaptive dead time control operates as follows. The high side and low side gate voltages are monitored to prevent the MOSFET turning on from tuning on until the other MOSFET's gate voltage is sufficiently low (< 1 V). Built in delays also ensure that one power MOSFET is completely off, before the other can be turned ON. This feature helps to adjust dead time as gate transitions change with respect to output current and temperature.

### Under Voltage Lockout (UVLO)

During the start up cycle, the UVLO disables the gate drive holding high side and low side MOSFET gates low until the supply voltage rail has reached a point at which the logic circuitry can be safely activated. The SiC632, SiC632A also incorporates logic to clamp the gate drive signals to zero when the UVLO falling edge triggers the shutdown of the device. As an added precaution, a 20 k $\Omega$  resistor is connected between GH (the high side gate) and PHASE to provide a discharge path for the HS MOSFET.

**PCB LAYOUT RECOMMENDATIONS**
**Step 1:  $V_{IN}/GND$  Planes and Decoupling**

1. Layout  $V_{IN}$  and  $P_{GND}$  planes as shown above
2. Ceramic capacitors should be placed right between  $V_{IN}$  and  $P_{GND}$ , and very close to the device for best decoupling effect
3. Difference values / packages of ceramic capacitors should be used to cover entire decoupling spectrum e.g. 1210, 0805, 0603, and 0402
4. Smaller capacitance value, closer to device  $V_{IN}$  pin(s) - better high frequency noise absorbing

**Step 2:  $V_{SWH}$  Plane**

1. Connect output inductor to DrMOS with large plane to lower the resistance
2. If any snubber network is required, place the components as shown above and the network can be placed at bottom

**Step 3:  $V_{CIN}/V_{DRV}$  Input Filter**

1. The  $V_{CIN}/V_{DRV}$  input filter ceramic cap should be placed very close to IC. It is recommended to connect two caps separately
2.  $C_{VCIN}$  cap should be placed between pin 3 and pin 4 ( $C_{GND}$  of driver IC) to achieve best noise filtering
3.  $C_{VDRV}$  cap should be placed between pin 28 ( $P_{GND}$  of driver IC) and pin 29 to provide maximum instantaneous driver current for low side MOSFET during switching cycle
4. For connecting  $C_{VCIN}$  analog ground, it is recommended to use large plane to reduce parasitic inductance

**Step 4: BOOT Resistor and Capacitor Placement**

1. These components need to be placed very close to IC, right between PHASE (pin 7) and BOOT (pin 5)
2. To reduce parasitic inductance, chip size 0402 can be used

**Step 5: Signal Routing**

1. Route the PWM / ZCD\_EN# / DSBL# / THWn signal traces out of the top left corner next DrMOS pin 1
2. PWM signal is very important signal, both signal and return traces need to pay special attention of not letting this trace cross any power nodes on any layer
3. It is best to “shield” traces from power switching nodes, e.g. V<sub>SWH</sub>, to improve signal integrity
4. GL (pin 27) has been connected with GL pad internally and does not need to connect externally

**Step 6: Adding Thermal Relief Vias**

1. Thermal relief vias can be added on the V<sub>IN</sub> and P<sub>GND</sub> pads to utilize inner layers for high current and thermal dissipation
2. To achieve better thermal performance, additional vias can be put on V<sub>IN</sub> plane and P<sub>GND</sub> plane
3. V<sub>SWH</sub> pad is a noise source and not recommended to put vias on this plane
4. 8 mil drill for pads and 10 mils drill for plane can be the optional via size. Vias on pad may drain solder during assembly and cause assembly issue. Please consult with the assembly house for guideline

**Step 7: Ground Connection**

1. It is recommended to make single connection between C<sub>GND</sub> and P<sub>GND</sub> and this connection can be done on top layer
2. It is recommended to make the whole inner 1 layer (next to top layer) ground plane and separate them into C<sub>GND</sub> and P<sub>GND</sub> plane
3. These ground planes provide shielding between noise source on top layer and signal trace on bottom layer

**Multi-Phases VRPower PCB Layout**

Following is an example for 6 phase layout. As can be seen, all the VRPower stages are lined in X-direction compactly with decoupling caps next to them. The inductors are placed as close as possible to the SiC632 and SiC632A to minimize the PCB copper loss. Vias are applied on all PADs ( $V_{IN}$ ,  $P_{GND}$ ,  $C_{GND}$ ) of the SiC632 and SiC632A to ensure that both electrical and thermal performance are excellent. Large copper planes are used for all the high current loops, such as  $V_{IN}$ ,  $V_{SWH}$ ,  $V_{OUT}$  and  $P_{GND}$ . These copper planes are duplicated in other layers to minimize the inductance and resistance. All the control signals are routed from the SiC632 and SiC632A to a controller placed to the north of the power stage through inner layers to avoid the overlap of high current loops. This achieves a compact design with the output from the inductors feeding a load located to the south of the design as shown in the figure.

ECN: T17-0423-Rev. F, 21-Aug-17 DWG: 6025						

### Notes

1. Use millimeters as the primary measurement
2. Dimensioning and tolerances conform to ASME Y14.5M. - 1994
3. Dimension b applies to plated terminal and is measured between 0.20 mm and 0.25 mm from terminal tip
4. The pin #1 identifier must be existed on the top surface of the package by using indentation mark or other feature of package body
5. Exact shape and size of this feature is optional
6. Package warpage max. 0.08 mm
7. Applied only for terminals

# Recommended Land Pattern PowerPAK<sup>®</sup> MLP55-31L

All dimensions in millimeters

## Disclaimer

ALL PRODUCT, PRODUCT SPECIFICATIONS AND DATA ARE SUBJECT TO CHANGE WITHOUT NOTICE TO IMPROVE RELIABILITY, FUNCTION OR DESIGN OR OTHERWISE.

Vishay Intertechnology, Inc., its affiliates, agents, and employees, and all persons acting on its or their behalf (collectively, "Vishay"), disclaim any and all liability for any errors, inaccuracies or incompleteness contained in any datasheet or in any other disclosure relating to any product.

Vishay makes no warranty, representation or guarantee regarding the suitability of the products for any particular purpose or the continuing production of any product. To the maximum extent permitted by applicable law, Vishay disclaims (i) any and all liability arising out of the application or use of any product, (ii) any and all liability, including without limitation special, consequential or incidental damages, and (iii) any and all implied warranties, including warranties of fitness for particular purpose, non-infringement and merchantability.

Statements regarding the suitability of products for certain types of applications are based on Vishay's knowledge of typical requirements that are often placed on Vishay products in generic applications. Such statements are not binding statements about the suitability of products for a particular application. It is the customer's responsibility to validate that a particular product with the properties described in the product specification is suitable for use in a particular application. Parameters provided in datasheets and / or specifications may vary in different applications and performance may vary over time. All operating parameters, including typical parameters, must be validated for each customer application by the customer's technical experts. Product specifications do not expand or otherwise modify Vishay's terms and conditions of purchase, including but not limited to the warranty expressed therein.

Hyperlinks included in this datasheet may direct users to third-party websites. These links are provided as a convenience and for informational purposes only. Inclusion of these hyperlinks does not constitute an endorsement or an approval by Vishay of any of the products, services or opinions of the corporation, organization or individual associated with the third-party website. Vishay disclaims any and all liability and bears no responsibility for the accuracy, legality or content of the third-party website or for that of subsequent links.

Vishay products are not designed for use in life-saving or life-sustaining applications or any application in which the failure of the Vishay product could result in personal injury or death unless specifically qualified in writing by Vishay. Customers using or selling Vishay products not expressly indicated for use in such applications do so at their own risk. Please contact authorized Vishay personnel to obtain written terms and conditions regarding products designed for such applications.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted by this document or by any conduct of Vishay. Product names and markings noted herein may be trademarks of their respective owners.
